Amazon Fine Food Reviews Analysis

Data Source: https://www.kaggle.com/snap/amazon-fine-food-reviews (https://www.kaggle.com/snap/amazon-fine-food-reviews (https://www.kaggle.com/snap/amazon-fine-food-reviews (https://www.kaggle.com/snap/amazon-fine-food-reviews (https://www.kaggle.com/snap/amazon-fine-food-reviews)

EDA: https://nycdatascience.com/blog/student-works/amazon-fine-foods-visualization/)

The Amazon Fine Food Reviews dataset consists of reviews of fine foods from Amazon.

Number of reviews: 568,454 Number of users: 256,059 Number of products: 74,258 Timespan: Oct 1999 - Oct 2012 Number of Attributes/Columns in data: 10

Attribute Information:

Id ProductId - unique identifier for the product UserId - unque identifier for the user ProfileName HelpfulnessNumerator - number of users who found the review helpful HelpfulnessDenominator - number of users who indicated whether they found the review helpful or not Score - rating between 1 and 5 Time - timestamp for the review Summary - brief summary of the review Text - text of the review Objective: Given a review, determine whether the review is positive (Rating of 4 or 5) or negative (rating of 1 or 2).

[Q] How to determine if a review is positive or negative?

[Ans] We could use the Score/Rating. A rating of 4 or 5 could be cosnidered a positive review. A review of 1 or 2 could be considered negative. A review of 3 is nuetral and ignored. This is an approximate and proxy way of determining the polarity (positivity/negativity) of a review.

Loading the data

The dataset is available in two forms

.csv file SQLite Database In order to load the data, We have used the SQLITE dataset as it easier to query the data and visualise the data efficiently. Here as we only want to get the global sentiment of the recommendations (positive or negative), we will purposefully ignore all Scores equal to 3. If the score id above 3, then the recommendation wil be set to "positive". Otherwise, it will be set to "negative".

```

[1]. Reading Data

```
In [2]: # using SQLite Table to read data.
        con = sqlite3.connect('D:\\TGM\\ML\\AmazonFineFoodReviews\\database.sqlite')
        # filtering only positive and negative reviews i.e.
        # not taking into consideration those reviews with Score=3
        # SELECT * FROM Reviews WHERE Score != 3 LIMIT 500000, will give top 500000 da
        ta points
        # you can change the number to any other number based on your computing power
        # filtered_data = pd.read_sql_query(""" SELECT * FROM Reviews WHERE Score != 3
        LIMIT 500000""", con)
        # for tsne assignment you can take 5k data points
        filtered data = pd.read sql query(""" SELECT * FROM Reviews WHERE Score !=
         3""", con)
        # Give reviews with Score>3 a positive rating(1), and reviews with a score<3 a
        negative rating(0).
        def partition(x):
            if x < 3:
                 return 0
            return 1
        #changing reviews with score less than 3 to be positive and vice-versa
        actualScore = filtered data['Score']
        positiveNegative = actualScore.map(partition)
        filtered data['Score'] = positiveNegative
        print("Number of data points in our data", filtered data.shape)
        filtered data.head(3)
```

Exploratory Data Analysis

[2] Data Cleaning: Deduplication It is observed (as shown in the table below) that the reviews data had many duplicate entries. Hence it was necessary to remove duplicates in order to get unbiased results for the analysis of the data. Following is an example:

In [7]: display= pd.read_sql_query("""
 SELECT *
 FROM Reviews
 WHERE Score != 3 AND UserId="AR5J8UI46CURR"
 ORDER BY ProductID
 """, con)
 display.head()

Out[7]:

	ld	ProductId	Userld	ProfileName	HelpfulnessNumerator	Helpful
0	78445	B000HDL1RQ	AR5J8UI46CURR	Geetha Krishnan	2	2
1	138317	B000HDOPYC	AR5J8UI46CURR	Geetha Krishnan	2	2
2	138277	B000HDOPYM	AR5J8UI46CURR	Geetha Krishnan	2	2
3	73791	B000HDOPZG	AR5J8UI46CURR	Geetha Krishnan	2	2
4	155049	B000PAQ75C	AR5J8UI46CURR	Geetha Krishnan	2	2

As can be seen above the same user has multiple reviews of the with the same values for HelpfulnessNumerator, HelpfulnessDenominator, Score, Time, Summary and Text and on doing analysis it was found that

ProductId=B000HDOPZG was Loacker Quadratini Vanilla Wafer Cookies, 8.82-Ounce Packages (Pack of 8)

ProductId=B000HDL1RQ was Loacker Quadratini Lemon Wafer Cookies, 8.82-Ounce Packages (Pack of 8) and so on

It was inferred after analysis that reviews with same parameters other than ProductId belonged to the same product just having different flavour or quantity. Hence in order to reduce redundancy it was decided to eliminate the rows having same parameters.

The method used for the same was that we first sort the data according to ProductId and then just keep the first similar product review and delete the others. for eg. in the above just the review for ProductId=B000HDL1RQ remains. This method ensures that there is only one representative for each product and deduplication without sorting would lead to possibility of different representatives still existing for the same product.

Observation:- It was also seen that in two rows given below the value of HelpfulnessNumerator is greater than HelpfulnessDenominator which is not practically possible hence these two rows too are removed from calcualtions

```
display= pd.read_sql_query("""
In [11]:
         SELECT *
         FROM Reviews
         WHERE Score != 3 AND Id=44737 OR Id=64422
         ORDER BY ProductID
         """, con)
         display.head()
```

Out[11]:

	ld	ProductId	Userld	ProfileName	HelpfulnessNumerator	Helpfulr
0	64422	B000MIDROQ	A161DK06JJMCYF	J. E. Stephens "Jeanne"	3	1
1	44737	B001EQ55RW	A2V0I904FH7ABY	Ram	3	2

In [12]: final=final[final.HelpfulnessNumerator<=final.HelpfulnessDenominator]</pre>

In [13]: #Before starting the next phase of preprocessing lets see the number of entrie s left print(final.shape)

> #How many positive and negative reviews are present in our dataset? final['Score'].value counts()

(364171, 10)

Out[13]: 1 307061

57110

Name: Score, dtype: int64

[3]. Text Preprocessing.

Now that we have finished deduplication our data requires some preprocessing before we go on further with analysis and making the prediction model.

Hence in the Preprocessing phase we do the following in the order below:-

- 1. Begin by removing the html tags
- 2. Remove any punctuations or limited set of special characters like, or . or # etc.
- 3. Check if the word is made up of english letters and is not alpha-numeric
- 4. Check to see if the length of the word is greater than 2 (as it was researched that there is no adjective in 2-letters)
- 5. Convert the word to lowercase
- 6. Remove Stopwords
- 7. Finally Snowball Stemming the word (it was observed to be better than Porter Stemming)

After which we collect the words used to describe positive and negative reviews

```
In [14]: # printing some random reviews
    sent_0 = final['Text'].values[0]
    print(sent_0)
    print("="*50)

sent_1000 = final['Text'].values[1000]
    print(sent_1000)
    print("="*50)

sent_1500 = final['Text'].values[1500]
    print(sent_1500)
    print("="*50)

sent_4900 = final['Text'].values[4900]
    print(sent_4900)
    print("="*50)
```

this witty little book makes my son laugh at loud. i recite it in the car as we're driving along and he always can sing the refrain. he's learned about wh ales, India, drooping roses: i love all the new words this book introduces and the silliness of it all. this is a classic book i am willing to bet my son will STILL be able to recite from memory when he is in college

I was really looking forward to these pods based on the reviews. Starbucks i s good, but I prefer bolder taste... imagine my surprise when I ordered 2 bo xes - both were expired! One expired back in 2005 for gosh sakes. I admit th at Amazon agreed to credit me for cost plus part of shipping, but geez, 2 years expired!!! I'm hoping to find local San Diego area shoppe that carries po ds so that I can try something different than starbucks.

Great ingredients although, chicken should have been 1st rather than chicken broth, the only thing I do not think belongs in it is Canola oil. Canola or r apeseed is not someting a dog would ever find in nature and if it did find ra peseed in nature and eat it, it would poison them. Today's Food industries ha ve convinced the masses that Canola oil is a safe and even better oil than ol ive or virgin coconut, facts though say otherwise. Until the late 70's it was poisonous until they figured out a way to fix that. I still like it but it could be better.

Can't do sugar. Have tried scores of SF Syrups. NONE of them can touch the excellence of this product.

/>cbr />Thick, delicious. Perfect. 3 ingredictions: Water, Maltitol, Natural Maple Flavor. PERIOD. No chemicals. No garb age.

/>cbr />Have numerous friends & family members hooked on this stuff. My husband & son, who do NOT like "sugar free" prefer this over major label regular syrup.

/>cbr />I use this as my SWEETENER in baking: cheesecakes, white brownies, muffins, pumpkin pies, etc... Unbelievably delicious...

/>cbr />Can you tell I like it?:)

Conclusion

Divided the dataset into Train, Test and CV, Used Train dataset to to train the each featurization.

Concluded as below from the above pretty table:

Here classifying the query point by considering K as odd number

- 1. TF-IDF Weighted W2V with brute force model provides best AUC when Hyperparameter is 43.
- 2. TF-IDF with KD TREE model provides the best AUC when hypermarameter is 41
- 3. TF-IDF Weighted W2V AUC score is high as compare to other vectorizer's.
